

PATH TO SUSTAINABLE RANGELAND MANAGEMENT

PHASE ONE

Undertake dialogues on pastoral livelihoods and village management to understand existing decision-making structures in a new village.

PHASE TWO

Map the village's pastures, select key plots, and conduct a baseline assessment of key ecological and social metrics.

PHASE 3

Select and train two community rangeland monitors in the village and equip them with technology and skills for monitoring.

ACTION

Community rangeland monitors use a mobile app to collect data and photos related to grass, grazing, and invasive species.

Collected data is uploaded to APW's ArcGIS Online portal for analysis. Recommendations for interventions are discussed with the grazing committee at rangeland feedback meetings.
